The term, 'context-sensitive help', means that the help system (documentation) opens to the correct topic, related your location in the software. This is possible because a unique identifier (ID, or page key) is assigned to each page.

For context-sensitive help to work properly, each page key must be set manually, and must be unique for each page. The page key is displayed in brackets behind the page title but is not visible to Wiki-Users. When you copy the documentation to a new space, the page key is forwarded to the new space.

For more information, see Adding a Page Key.
