Scroll Translations compatible Content by Label macro

Scroll Translations 1.2 is now fully compatible with the Content by Label macro. It is now possible to use the macro on translated pages and display the correct page title. When installing Scroll Translations, the existing Content by Label macro gets automatically replaced. You don't have to change your existing content!

The new macro offers the following features:

- Compatible with Scroll Versions and Scroll Translations – No more duplicate links: Depending on the selected working version, variant, or language, only the corresponding page is displayed.
- Uses Scroll page title – Confusing links are a thing of the past: The new macro now resolves the correct page title.
- Works with fallbacks – If a page with a certain label doesn't exist in the selected version, the macro displays the previous version, just like the fallback functionality you already know from versioned pages.

?? Unknown Attachment

Translation ZIP is now validated

The Translation ZIP is now checked for plausibility when imported back to Confluence.

The following checks are performed when a translation ZIP is imported:

On space level:

- Check if the referenced space exists
- Check if the referenced languages exist in space, by checking the attributes
  - Language
  - OriginalLanguage
  - TargetLanguage
- Check if the referenced version exists
- Check if the referenced variant exists

On page level:

- Check if the page exists for the referenced page id
- Check if the translated version is the latest version
- Check that the title attribute is not empty
Translations ZIP is validated

Use the permalink feature in published spaces

If you use the permalink feature you can now control to keep the defined permalink when publishing a language to a new space.
