Scroll Versions 3.0.3 Upgrade Notes

Below are some important notes on upgrading to Scroll Versions 3.0.3. For details of the new features and improvements in this release, please read the Scroll Versions 3.0.3 Release Notes.

- Upgrade Notes
  - Confluence version support
  - Custom theme support
  - Browser support
  - Plugin dependencies
  - Upgrade procedure

Upgrade Notes

Confluence version support

As announced in the Scroll Versions 2.8 release notes, this version of Scroll Versions no longer supports Confluence 5.2 and earlier.

Custom theme support

To implement compatibility with Refined Wiki, Enterprise Theme, and all default themes, we removed the Scroll Versions theme and all dependent resources. All spaces using the Scroll Versions theme will be automatically migrated to a corresponding Confluence theme. If you have built your own custom Scroll Version (2.x) compatible theme please contact our support team to discuss further steps.

Browser support

Scroll Versions 3.0.3 no longer supports Internet Explorer 9 and earlier.

Plugin dependencies

After installing Scroll Versions 3.0.3, the following add-ons should be installed and enabled, as they're bundled with Scroll Versions:

- Scroll Versions 3.0.3
- Scroll Platform 3.0.3
- Scroll Runtime for Confluence 1.3.1

If one of the mentioned add-ons is not enabled, please try to enable it manually. If it can not be enabled, please clear the plugins cache and restart your Confluence system.

Upgrade procedure

- **Note:** Upgrade to a test environment first. Test your upgrades in your test environment before rolling them into production. For production environments please consider a backup.
- Scroll Versions 3.0.3 can not be downgraded to an earlier version.
